YOUTH, RECAPTURED

CYROSTEM CELL THERAPY AT WHITE TEA MED SPA

The future of anti-aging skin care is here. While stem cell facials have been controversial in the past, they are now taking the medical and med spa world by storm with an increasingly popular procedure. Science already knows that animal cultivated organs have made medical history and miracles come to life while co-existing with the human body once implanted. Why not skin? There is no doubt that society values eternal youth, and now it is possible to get closer to this desire safely and effectively via CyroStem Cell Therapy in the heart of New York City.

When the average person thinks of Manhattan's top tier spas, words such as luxury and innovation come to mind. White

Tea Med Spa, based in the Big Apple, is the first ever NYC-based spa to offer a DNA Skin Care CyroStem Cell Therapy facial as well as a DNA CyroStem Cell skincare line. Clean and inviting, it is truly an oasis on the border of Chelsea and the West Village.

"Thanks to the recent advances in stem cell technology, we are able to help our clients achieve a variety of skincare goals, including a more youthful face, younger looking neck and glowing décolleté," says White Tea Med Spa's lead esthetician, Maria Rianna-Boyajian. "We pride ourselves on bringing New York City the latest in skincare treatments, and this stem cell facial surpasses every other anti-aging facial on the market."

Setting the bar, CyroStem Biological Cellular Therapy is a

revolutionary skin repair procedure for medial and esthetics professionals to offer. A new gold standard in skin therapy, there is a complete answer to aging skin for the first time in history. It is the most effective and all natural treatment to date.

In the past 200 years, over 300,000 new man-made chemicals have been introduced and exposed to people across the planet. Some of the most potent chemicals are found within cosmetics and skin care products. CryoStem skin biotech is completely organic. The serum contains vital nutrients such as proteins, vitamins, minerals, enzymes, essential fatty acids, amino acids, antioxidants and growth factors that communicate with the skin for proper cell renewal. The CryoStem system is a complete nutrition complex that is in complete equilibrium.

Everyone in this world wants to age in the healthiest way possible. A driving force behind the work of daring visionaries that range from researchers, to scientists and physicians are challenging aging, disease and death itself on a daily basis. Breakthrough discoveries in bioscience and biotechnology are changing the way that people live and age. Noel Santana Aguilar, Ph.D., H.M.D. is one of the people who has broken the barriers to slowing this downward spiral. The pioneer in innovative technology of Stem Cell Skin Therapy, Dr. Aguilar successfully reached a conclusion on how to achieve younger looking skin through the use of his groundbreaking DNA CryoStem Skin Therapy System. Developed by using Hibernated Biogenesis, a technique that is a direct utilization of cryogenically preserved (frozen) embryonic serum containing skin stem cells, it is simple to break down how the technique works. Skin cells can be compared to a human being: while they start off full of energy, they lose strength and become more independent due to surrounding tissues deteriorating, resulting in progressive aging throughout the body.

The reason to use stem cells is quite simple: stem cells are the most powerful agents in healing damaged tissue and creating new cells for skin regeneration. Like humans, cells need other cells for information, support, direction and nourishment. New cells that are energetically charged and vital are extracted from a controlled source of organic cows. Cow cells, or bovines, roam free-range in an unspoiled area of the French Alps. The cells are organically fed and are steroid as well as antibiotic free. The cells are well taken care of and are kept in a safe and nurturing environment, which the DNA Health Institute makes sure is a top priority.

The embryonic proteins, which are rich in nutrients and stem cells, are extracted during a calculated timeline that falls within the first trimester of the bovine's pregnancy in order to achieve the maximum amount of stem cells. How is the extraction performed? A small amount of embryonic protein is guided by ultra sound imaging from umbilical stem and bulb,

the membrane that surrounds the fetus in the uterus. This method allows for a cruelty-free method that does not harm the bovines, and it protects the health and well-being of the mother bovine along with her fetus as well. This process is done in a laboratory under absolute sterile conditions. Strict veterinary and pharmaceutical controls are performed during this process under strict European governmental supervision, which meet and exceed regulatory agencies of Europe and the United States. The protein is not specific to the genetic composition of the bovine, however it contains DNA information that influences and supports human skin. The new cells are disease free, programmed and not autonomous, which results in a flawless appearance.

Once the final product is created, the biological embryonic cellular serum is flash frozen in individual sterile ampoules that will be shipped. The ampoules are kept frozen until used on spa goer as a part of the DNA CryoStem skin rejuvenation series and/or to complement both surgical and/or non-surgical esthetics procedures. By keeping the cells at freezing temperatures, the cells are able to hibernate. This technique allows the cells to

remain active and maintain the unity of molecules. When the skin is introduced to new energy-filled embryonic cells, it will make existing cells feel younger. And when enough of these new cells are around, the older cells will start to act younger and will respond to a new atmosphere of energy.

In the world of esthetics, the specific organ is skin. The CryoStem biologically active serum specifically targets skin to achieve results. The serum is processed to retain all the constituents of skin-components required for skin cell renewal and total skin rejuvenation. By being tissue specific, the tissue has a match along with its energetics, consciousness and biological functions. In other words, the serum performs the same functions and tasks as live human skin identically. The skin and serum are in sync with one another, which in turn allows the skin to repair, heal and rejuvenate.

While there are two professional facial options to choose from at White Tea Med Spa, the DNA Natural Facelift is the ultimate facial choice that the spa goer can make. The treatment begins with an organic facial, exfoliating peel and microdermabrasion, which prepares the skin for the serum as well as a Microcurrent treatment. A licensed medical esthetician tones the facial

muscles with a peptide fueled by firming Microcurrent. Two silver rods come in contact with the face and the spa goer remains still, and feels pulses where the silver rods are placed. By doing this, the skin is able to absorb more of the collagen-boosting ingredients from the serum. Once the Microcurrent is done, the serum is applied to the face, neck and décolleté. Instantly, the areas where the serum is applied has a hydrated dewy appearance. Gone are the days of fine lines and wrinkles around the mouth and eyes. Facial stress is combated as well as other visible signs of aging that come from environmental factors as well.

While the use of stem cells may seem alarming, there are no risks or foreseen side effects with the treatment. The bovine stem cells are too large to be absorbed into the human body, and the skin absorbs just the signaling factors and the other nutrients. The serum is specific and cannot cause any harm or stimulate growth of any other type of cell. Foreign DNA cannot enter the skin, and no genetic alterations or mutations occur. The technology and system of delivery has been evaluated in great depth by the United States Food & Drug Administration (FDA), and has received FDA clearance for consumer safety and

distribution in the year 2000.

In order to achieve maximum results, it is recommended that the spa-goer does a series of CryoStem treatments. A basic series consists of 6-10 treatments over a period of 3 months. The effects of each treatment will continue and peak at 6 days. The amount of treatments is specific to the user's skin care needs. Usually a six-session treatment series will enable a person to experience incredible results. After the series, the user may choose to schedule booster treatments occasionally, while some individuals may want to repeat the full series as part of a preventative program. The number of treatments depends on what the individual wants. The results of the program mainly rely on making healthy lifestyle choices that fall under diet, hydration, hydration, safe sun exposure and protection from other environmental factors. With the introduction of genetically flawless bovine embryonic cultured mediums in order to make it specifically effective to human skin, older and weaker cells will begin to replicate into future generations of younger, stronger skin with a youthful appearance.

To continue treatment outside of the spa or a medical office CryoStem products are made available for home use in lower concentration levels. The CryoStem Skin Therapy System consists of 100% natural, chemical and preservative-free skin care formulations that continue the support started by the DNA professional treatments. The organic ingredient base of the system is what enables the skin stem cells to continue support. These organic ingredients include phytochemicals, plant antioxidants, plant fragrances, essential flower/seed oils and ocean vegetation.

Two products within the CryoStem Skin Therapy System, The CryoStem Lift Stick and Lift Stick Sprayers, offer the benefits of the DNA CryoStem biological cellular serum, and are easy to apply. When used daily, the CryoStem Lift Stick and CryoStem Lift Stick Sprayers provide high-powered skin rejuvenating benefits of cell-to-cell activity, helping to produce the corrective attributes that partake in the future generations of skin. When used with the professional CryoStem Cell Therapy Treatment, the CryoStem Lift Stick and CryoStem Lift Stick Sprays continue the corrective, firming, clarifying and anti-aging benefits that originated from the professional service. Since the CryoStem Lift Stick contains frozen skin stem cells, it must be kept frozen between applications.

If you are looking to utilize the power of stem cell technology, come experience this new DNA Stem Cell Treatment and purchase CryoStem Skin Therapy System products at White Tea Med Spa, located at 104 West 14th Street, Suite 2C New York, NY 10011. Recapture your youth. Love your skin again. DNASkin.com; WhiteTeaMedSpa.com
